We are often asked what are some signs that indicate a WordPress site is hacked? There are some common telltale signs that may help you figure out if your WordPress site is hacked or compromised. In this article, we will share 12 common signs that your WordPress site is hacked.

If you look at your Google Analytics reports and see a sudden drop in traffic, then this could be a sign that your WordPress site is hacked.

There are many malware and trojans out there that hijack your website's traffic and redirect it to spammy websites. Some of them don't redirect logged in users which allows them to go unn[oticed for a while.](#)

[Another reason for the sudden drop in](#)traffic is Google's safe browsing tool, which might be showing warnings to users regarding your website.
Each week, Google blacklists around 20,000 websites for malware and around 50,000 for phishing. That's why every blogger and business owner needs to pay serious attention to their WordPress security.

You can check your website using the Google's safe browsing tool to see your safety report.

Can iPhones get viruses? Although rare, your iPad or iPhone can be infected with malware. You don't need an antivirus app or a virus cleaner to get rid of it; we'll go over how to improve your iPhone security via virus protection, how to do a virus scan or check, iPhone virus removal,
